Paper goods

Observations

Paper is made by mixing small pieces of wood with water and chemicals. Paper is used to make books, newspapers, toilet paper, tissue paper, writing paper, wrapping paper, cardboard, paper cups, and many other everyday things.

Science activity

Some types of paper are stronger than others. They can hold other objects without breaking. For example, a paper plate can hold food. Which types of paper below are strong, and which are not strong? Place a check mark (✓) in the correct box in the chart.

	Paper	Strong	Not strong
	newspaper		
	paper towel		
	writing paper		
	tissues		
	toilet paper		
	cardboard		
	paper cup		
	wrapping paper		

Science exploration

Predict and test which type of paper best wipes up water. Chart what happens.

Polar species are water-soluble, while oils and fats are soluble in non-polar species. The like dissolves like law is used for covalent solubility. This means the liquids would be soluble in each other with the same form of polarity. In addition, molecules would be insoluble in each other with varying polarities. The mixture is passed through the pores of the sieve. All the smaller substances pass through easily while the bigger components of the mixture are retained. Evaporation. Evaporation is a technique that is used in separating a mixture usually a solution of a solvent and a soluble solid. Insoluble substance cannot dissociate into ions in water. The following diagram shows how to write the ionic equation for the reaction of aqueous sodium carbonate with aqueous barium nitrate. Scroll down the page for more examples and solutions on writing ionic equations. Under this process breakdown of large insoluble food molecules so that they can be absorbed into the watery blood plasma. In certain organisms, these smaller substances are absorbed through the small intestine into the bloodstream. During all this processing the digestive system/tract plays a very crucial ... In the reaction (2) one substance FeSO 4 (Ferrous sulphate) splits into three substances ferric oxide (Fe 2 O 3), sulphur dioxide (SO 2), and sulphur trioxide (SO 3) due to heat. Therefore this reaction is called decomposition reaction or also known as a thermal decomposition reaction.
